## PIPERIDINYL PROSTAGLANDIN E ANALOGS

### Field of the Invention

5

The present invention relates to piperidiny l prostaglandin E analogs useful as therapeutic agents, e.g. ocular hypotensives that are particularly suited for the management of glaucoma.

10

### Background of the Invention

### Description of Related Art

15 Ocular hypotensive agents are useful in the treatment of a number of various ocular hypertensive conditions, such as post-surgical and post-laser trabeculectomy ocular hypertensive episodes, glaucoma, and as presurgical adjuncts.

20 Glaucoma is a disease of the eye characterized by increased intraocular pressure. On the basis of its etiology, glaucoma has been classified as primary or secondary. For example, primary glaucoma in adults (congenital glaucoma) may be either open-angle or acute or chronic angle-closure. Secondary glaucoma results from pre-existing ocular diseases such as uveitis, intraocular tumor or an enlarged cataract.

25 The underlying causes of primary glaucoma are not yet known. The increased intraocular tension is due to the obstruction of aqueous humor outflow. In chronic open-angle glaucoma, the anterior chamber and its anatomic structures appear normal, but drainage of the aqueous humor is impeded. In acute or chronic angle-closure glaucoma, the anterior chamber is shallow, the filtration angle is narrowed, and the iris may obstruct the trabecular meshwork at the entrance of the canal of Schlemm. Dilation of the pupil may push the root of the iris forward against the angle, and may produce pupillary block and thus precipitate an acute attack. Eyes

with narrow anterior chamber angles are predisposed to acute angle-closure glaucoma attacks of various degrees of severity.

Secondary glaucoma is caused by any interference with the flow of aqueous humor from the posterior chamber into the anterior chamber and subsequently, into the canal of Schlemm. Inflammatory disease of the anterior segment may prevent aqueous escape by causing complete posterior synechia in iris bombe, and may plug the drainage channel with exudates. Other common causes are intraocular tumors, enlarged cataracts, central retinal vein occlusion, trauma to the eye, operative procedures and intraocular hemorrhage.

Considering all types together, glaucoma occurs in about 2% of all persons over the age of 40 and may be asymptotic for years before progressing to rapid loss of vision. In cases where surgery is not indicated, topical  $\beta$ -adrenoreceptor antagonists have traditionally been the drugs of choice for treating glaucoma.

Certain eicosanoids and their derivatives have been reported to possess ocular hypotensive activity, and have been recommended for use in glaucoma management. Eicosanoids and derivatives include numerous biologically important compounds such as prostaglandins and their derivatives. Prostaglandins can be described as derivatives of prostanoic acid which have the following structural formula:

Various types of prostaglandins are known, depending on the structure and substituents carried on the alicyclic ring of the prostanoic acid skeleton. Further classification is based on the number of unsaturated bonds in the side chain indicated

by numerical subscripts after the generic type of prostaglandin [e.g. prostaglandin E<sub>1</sub> (PGE<sub>1</sub>), prostaglandin E<sub>2</sub> (PGE<sub>2</sub>)], and on the configuration of the substituents on the alicyclic ring indicated by  $\alpha$  or  $\beta$  [e.g. prostaglandin F<sub>2</sub> $\alpha$  (PGF<sub>2</sub> $\beta$ )].

Prostaglandins were earlier regarded as potent ocular hypertensives, however,  
5 evidence accumulated in the last decade shows that some prostaglandins are highly effective ocular hypotensive agents, and are ideally suited for the long-term medical management of glaucoma (see, for example, Bito, L.Z. Biological Protection with Prostaglandins, Cohen, M.M., ed., Boca Raton, Fla, CRC Press Inc., 1985, pp. 231-252; and Bito, L.Z., Applied Pharmacology in the Medical Treatment of Glaucomas  
10 Drance, S.M. and Neufeld, A.H. eds., New York, Grune & Stratton, 1984, pp. 477-505. Such prostaglandins include PGF<sub>2</sub> $\alpha$ , PGF<sub>1</sub> $\alpha$ , PGE<sub>2</sub>, and certain lipid-soluble esters, such as C<sub>1</sub> to C<sub>2</sub> alkyl esters, e.g. 1-isopropyl ester, of such compounds.

Although the precise mechanism is not yet known experimental results indicate that the prostaglandin-induced reduction in intraocular pressure results from  
15 increased uveoscleral outflow [Nilsson et.al., Invest. Ophthalmol. Vis. Sci. (suppl), 284 (1987)].

The isopropyl ester of PGF<sub>2</sub> $\alpha$  has been shown to have significantly greater hypotensive potency than the parent compound, presumably as a result of its more effective penetration through the cornea. In 1987, this compound was described as  
20 "the most potent ocular hypotensive agent ever reported" [see, for example, Bito, L.Z., Arch. Ophthalmol. 105, 1036 (1987), and Siebold et.al., Prodrug 5:3 (1989)].

Whereas prostaglandins appear to be devoid of significant intraocular side effects, ocular surface (conjunctival) hyperemia and foreign-body sensation have been consistently associated with the topical ocular use of such compounds, in  
25 particular PGF<sub>2</sub> $\alpha$  and its prodrugs, e.g., its 1-isopropyl ester, in humans. The clinical potentials of prostaglandins in the management of conditions associated with increased ocular pressure, e.g. glaucoma are greatly limited by these side effects.

In a series of co-pending United States patent applications assigned to Allergan, Inc. prostaglandin esters with increased ocular hypotensive activity accompanied with no or substantially reduced side-effects are disclosed. The co-pending USSN 596,430 (filed 10 October 1990, now U.S. Patent 5,446,041), relates to certain 11-acyl-prostaglandins, such as 11-pivaloyl, 11-acetyl, 11-isobutyryl, 11-valeryl, and 11-isovaleryl PGF<sub>2</sub>α. Intraocular pressure reducing 15-acyl prostaglandins are disclosed in the co-pending application USSN 175,476 (filed 29 December 1993). Similarly, 11,15- 9,15 and 9,11-diesters of prostaglandins, for example 11,15-dipivaloyl PGF<sub>2</sub>α are known to have ocular hypotensive activity. See the co-pending patent applications USSN Nos. 385,645 (filed 07 July 1989, now U.S. Patent 4,994,274), 584,370 (filed 18 September 1990, now U.S. Patent 5,028,624) and 585,284 (filed 18 September 1990, now U.S. Patent 5,034,413). The disclosures of all of these patent applications are hereby expressly incorporated by reference.

Certain piperidinyl prostaglandin E analogues have been disclosed for treating glaucoma. See U.S. Patent Application 10/456,275, filed on June 6, 2003, which is hereby expressly incorporated by reference.

Pharmaceutical compositions may be prepared by combining a therapeutically effective amount of at least one compound according to the present invention, or a pharmaceutically acceptable acid addition salt thereof, as an active ingredient, with conventional ophthalmically acceptable pharmaceutical excipients, and by  
20 preparation of unit dosage forms suitable for topical ocular use. The therapeutically efficient amount typically is between about 0.0001 and about 5% (w/v), preferably about 0.001 to about 1.0% (w/v) in liquid formulations.

For ophthalmic application, preferably solutions are prepared using a physiological saline solution as a major vehicle. The pH of such ophthalmic solutions  
25 should preferably be maintained between 6.5 and 7.2 with an appropriate buffer system. The formulations may also contain conventional, pharmaceutically acceptable preservatives, stabilizers and surfactants.

Preferred preservatives that may be used in the pharmaceutical compositions of the present invention include, but are not limited to, benzalkonium chloride,  
30 chlorobutanol, thimerosal, phenylmercuric acetate and phenylmercuric nitrate. A preferred surfactant is, for example, Tween 80. Likewise, various preferred vehicles may be used in the ophthalmic preparations of the present invention. These vehicles include, but are not limited to, polyvinyl alcohol, povidone, hydroxypropyl methyl

cellulose, poloxamers, carboxymethyl cellulose, hydroxyethyl cellulose and purified water.

Tonicity adjustors may be added as needed or convenient. They include, but are not limited to, salts, particularly sodium chloride, potassium chloride, mannitol  
5 and glycerin, or any other suitable ophthalmically acceptable tonicity adjustor.

Various buffers and means for adjusting pH may be used so long as the resulting preparation is ophthalmically acceptable. Accordingly, buffers include acetate buffers, citrate buffers, phosphate buffers and borate buffers. Acids or bases may be used to adjust the pH of these formulations as needed.

10 In a similar vein, an ophthalmically acceptable antioxidant for use in the present invention includes, but is not limited to, sodium metabisulfite, sodium thiosulfate, acetylcysteine, butylated hydroxyanisole and butylated hydroxytoluene.

Other excipient components which may be included in the ophthalmic preparations are chelating agents. The preferred chelating agent is edentate disodium,  
15 although other chelating agents may also be used in place or in conjunction with it.

The ingredients are usually used in the following amounts:

	<u>Ingredient</u>	<u>Amount (% w/v)</u>
	active ingredient	about 0.001-5
20	preservative	0-0.10
	vehicle	0-40
	tonicity adjustor	1-10
	buffer	0.01-10
	pH adjustor	q.s. pH 4.5-7.5
25	antioxidant	as needed
	surfactant	as needed
	purified water	as needed to make 100%

The actual dose of the active compounds of the present invention depends on  
30 the specific compound, and on the condition to be treated; the selection of the appropriate dose is well within the knowledge of the skilled artisan.

The ophthalmic formulations of the present invention are conveniently packaged in forms suitable for metered application, such as in containers equipped with a dropper, to facilitate the application to the eye. Containers suitable for dropwise application are usually made of suitable inert, non-toxic plastic material, and generally contain between about 0.5 and about 15 ml solution.

This invention is further illustrated by the following non-limiting Examples.

### Example 1

{4-[(R)-2-Oxo-6-((E)-3-oxo-4-phenyl-but-1-enyl)-piperidin-1-yl]-butoxy}-acetic acid methyl ester

Step 1. (R)-6-(1-Ethoxyethoxymethyl)-piperidin-2-one

Ethyl vinyl ether (1.68 mL, 17.5 mmol) and trifluoroacetic acid (0.1 mL) were added sequentially to a solution of (R)-6-hydroxymethylpiperidin-2-one (prepared from D- $\alpha$ -aminoadipic acid according to Huang, et al., *Synth. Commun.* **1989**, *19*, 3485-3496, 1.62 g, 12.5 mmol) in CHCl<sub>3</sub> (10 mL) at rt. The reaction mixture was stirred at rt for 18 h, then saturated aqueous NaHCO<sub>3</sub> (100 mL) was added and the mixture was extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 x 75 mL). The combined organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (CH<sub>2</sub>Cl<sub>2</sub>  $\rightarrow$  4% MeOH/CH<sub>2</sub>Cl<sub>2</sub>, gradient) afforded 2.03 g (80%) of (R)-6-(1-ethoxyethoxymethyl)-piperidin-2-one.

Step 2. {(Z)-4-[(R)-2-(1-Ethoxyethoxymethyl)-6-oxo-piperidin-1-yl]-but-2-enyloxy}-acetic acid ethyl ester

Sodium hydride (60% dispersion in oil, 402 mg, 10.0 mmol) was added to a solution of (R)-6-(1-ethoxyethoxymethyl)-piperidin-2-one (2.02 g, 10.0 mmol) in DMF (15 mL) at 0 °C. After 1 h, a solution of potassium iodide (1.66 g, 10.0 mmol) and ((Z)-4-chloro-but-2-enyloxy)-acetic acid ethyl ester (prepared according to PCT 2003/007941, 3.09 g, 16.0 mmol) in DMF (10 mL) was added via cannula. The reaction was allowed to warm to rt. After 18 h at rt, the reaction was quenched

by the addition of saturated aqueous  $\text{NaHCO}_3$  (100 mL) and the mixture was extracted with EtOAc (3 x 100 mL). The combined organic phase was washed with brine (3 x 100 mL), dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (10% EtOAc/ $\text{CH}_2\text{Cl}_2$  → 60% EtOAc/ $\text{CH}_2\text{Cl}_2$ , gradient) afforded 1.10 g (31%) of {(Z)-4-[(R)-2-(1-ethoxyethoxymethyl)-6-oxo-piperidin-1-yl]-but-2-enyloxy}-acetic acid ethyl ester.

Step 3. [(Z)-4-((R)-2-Hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-enyloxy]-acetic acid methyl ester

10 *p*-Toluenesulfonic acid hydrate (620 mg, 3.26 mmol) was added to a solution of {(Z)-4-[(R)-2-(1-ethoxyethoxymethyl)-6-oxo-piperidin-1-yl]-but-2-enyloxy}-acetic acid ethyl ester (1.10 g, 3.08 mmol) in MeOH (10 mL). After 17 h at rt, the reaction was quenched with saturated aqueous  $\text{NaHCO}_3$  (20 mL) and the mixture was extracted with  $\text{CH}_2\text{Cl}_2$  (3 x 30 mL). The combined organic phase was dried  
15 ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (40% EtOAc/ $\text{CH}_2\text{Cl}_2$  → 60% EtOAc/ $\text{CH}_2\text{Cl}_2$ , gradient, then 7% MeOH/ $\text{CH}_2\text{Cl}_2$ ) afforded 538 mg (64%) of [(Z)-4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-enyloxy]-acetic acid methyl ester.

20 Step 4. [4-((R)-2-Hydroxymethyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester

Palladium on carbon (10 wt. %, 25 mg) was added to a solution of [(Z)-4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-but-2-enyloxy]-acetic acid methyl ester (318 mg, 1.17 mmol) in MeOH (5.0 mL). A hydrogen atmosphere was established by  
25 evacuating and refilling with hydrogen (3x) and the reaction mixture was stirred under a balloon of hydrogen for 2.25 h. The reaction mixture was filtered through celite, washing with MeOH, and the filtrate was concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (30% EtOAc/ $\text{CH}_2\text{Cl}_2$  → 50% EtOAc/ $\text{CH}_2\text{Cl}_2$ , gradient, then 2% MeOH/ $\text{CH}_2\text{Cl}_2$  → 5%

MeOH/CH<sub>2</sub>Cl<sub>2</sub>) afforded 285 mg (89%) of [4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester.

Step 5. [4-((R)-2-Formyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester

- 5 A solution of oxalyl chloride (0.15 mL, 1.76 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1.0 mL) was added to a solution of DMSO (0.16 mL, 2.25 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1.0 mL) at -78 °C. After 15 min at -78 °C, a solution of [4-((R)-2-hydroxymethyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester (240 mg, 0.88 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (1.5 mL) was added via cannula. After 20 min at -78 °C, triethylamine (0.37 mL, 2.65 mmol)
- 10 was added. After 20 min at -78 °C, the mixture was allowed to warm to 0 °C. After 30 min at 0 °C, the reaction was allowed to warm to rt. After 45 min at rt, saturated aqueous NaHCO<sub>3</sub> (15 mL) was added and the mixture was extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 x 15 mL). The combined organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography
- 15 on silica gel (40% → 70% EtOAc/CH<sub>2</sub>Cl<sub>2</sub>, gradient) afforded 96 mg (40%) of [4-((R)-2-formyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester.

Step 6. {4-[(R)-2-Oxo-6-((E)-3-oxo-4-phenyl-but-1-enyl)-piperidin-1-yl]-butoxy}-acetic acid methyl ester

- 20 Sodium hydride (60% dispersion in oil, 14 mg, 0.35 mmol) was added to a solution of dimethyl 2-oxo-3-phenylpropylphosphonate (83 mg, 0.34 mmol) in THF (1.0 mL) at 0 °C. After 1 h at 0 °C, [4-((R)-2-formyl-6-oxo-piperidin-1-yl)-butoxy]-acetic acid methyl ester (94 mg, 0.35 mmol) in THF (1 mL) was added via cannula. The reaction was allowed to warm to rt. After 22 h at rt, the reaction was quenched
- 25 with saturated aqueous NH<sub>4</sub>Cl (10 mL) and extracted with EtOAc (3 x 15 mL). The combined organic phase was washed with brine (20 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated in vacuo. DBU (6.6  $\mu$ L, 0.044 mmol) was added to a solution of (4-{(R)-2-[(E)-4-(3-chlorophenyl)-3-hydroxy-but-1-enyl]-6-oxo-piperidin-1-yl}-but-2-ynyloxy)-acetic acid (12 mg, 0.030 mmol) in acetone (0.3 mL). After 5 min, 2-iodopropane (15  $\mu$ L, 0.15 mmol) was added. After 19 h, the reaction mixture was concentrated in vacuo, 5 0.5 M aqueous HCl (5 mL) was added and the mixture was extracted with EtOAc (3 x 5 mL). The combine organic phase was washed with saturated aqueous NaHCO<sub>3</sub> (10 mL) and brine (10 mL) then dried (MgSO<sub>4</sub>), filtered and concentrated in vacuo. Purification of the residue by flash column chromatography on silica gel (CH<sub>2</sub>Cl<sub>2</sub>  $\rightarrow$  3% MeOH/CH<sub>2</sub>Cl<sub>2</sub>, gradient) afforded 7.9 mg (60%) of the title 10 compound.

These compounds are tested for in vitro activity as described below and the results given in the Table.

## HUMAN RECOMBINANT EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub>, FP, TP, IP and DP RECEPTORS: STABLE TRANSFECTANTS.

Plasmids encoding the human EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub>, FP, TP, IP and DP  
5 receptors were prepared by cloning the respective coding sequences into the  
eukaryotic expression vector pCEP4 (Invitrogen). The pCEP4 vector contains an  
Epstein Barr virus (EBV) origin of replication, which permits episomal replication  
in primate cell lines expressing EBV nuclear antigen (EBNA-1). It also contains a  
hygromycin resistance gene that is used for eukaryotic selection. The cells  
10 employed for stable transfection were human embryonic kidney cells (HEK-293)  
that were transfected with and express the EBNA-1 protein. These HEK-293-  
EBNA cells (Invitrogen) were grown in medium containing Geneticin (G418) to  
maintain expression of the EBNA-1 protein. HEK-293 cells were grown in DMEM  
with 10% fetal bovine serum (FBS), 250 µg ml<sup>-1</sup> G418 (Life Technologies) and 200  
15 µg ml<sup>-1</sup> gentamicin or penicillin/streptomycin. Selection of stable transfectants was  
achieved with 200 µg ml<sup>-1</sup> hygromycin, the optimal concentration being determined  
by previous hygromycin kill curve studies.

For transfection, the cells were grown to 50-60% confluency on 10 cm  
plates. The plasmid pCEP4 incorporating cDNA inserts for the respective human  
20 prostanoid receptor (20 µg) was added to 500 µl of 250 mM CaCl<sub>2</sub>. HEPES  
buffered saline x 2 (2 x HBS, 280 mM NaCl, 20 mM HEPES acid, 1.5 mM Na<sub>2</sub>  
HPO<sub>4</sub>, pH 7.05 – 7.12) was then added dropwise to a total of 500 µl, with  
continuous vortexing at room temperature. After 30 min, 9 ml DMEM were added  
to the mixture. The DNA/DMEM/calcium phosphate mixture was then added to  
25 the cells, which had been previously rinsed with 10 ml PBS. The cells were then  
incubated for 5 hr at 37° C in humidified 95% air/5% CO<sub>2</sub>. The calcium phosphate  
solution was then removed and the cells were treated with 10% glycerol in DMEM  
for 2 min. The glycerol solution was then replaced by DMEM with 10% FBS. The  
cells were incubated overnight and the medium was replaced by DMEM/10% FBS

containing 250  $\mu\text{g ml}^{-1}$  G418 and penicillin/streptomycin. The following day hygromycin B was added to a final concentration of 200  $\mu\text{g ml}^{-1}$ .

Ten days after transfection, hygromycin B resistant clones were individually selected and transferred to a separate well on a 24 well plate. At confluence each  
5 clone was transferred to one well of a 6 well plate, and then expanded in a 10 cm dish. Cells were maintained under continuous hygromycin selection until use.

### **RADIOLIGAND BINDING**

10 Radioligand binding studies on plasma membrane fractions prepared for cells stably transfected with the cat or human receptor were performed as follows. Cells washed with TME buffer were scraped from the bottom of the flasks and homogenized for 30 sec using a Brinkman PT 10/35 polytron. TME buffer was added as necessary to achieve a 40 ml volume in the centrifuge tubes. TME is  
15 comprised of 50 mM TRIS base, 10 mM  $\text{MgCl}_2$ , 1 mM EDTA; pH 7.4 is achieved by adding 1 N HCl. The cell homogenate was centrifuged at 19,000 rpm for 20-25 min at 4°C using a Beckman Ti-60 or Ti-70 rotor. The pellet was then resuspended in TME buffer to provide a final protein concentration of 1 mg/ml, as determined by Bio-Rad assay. Radioligand binding assays were performed in a 100  $\mu\text{l}$  or 200  
20  $\mu\text{l}$  volume.

The binding of [ $^3\text{H}$ ](N)  $\text{PGE}_2$  (specific activity 165 Ci/mmol) was determined in duplicate and in at least 3 separate experiments. Incubations were for 60 min at 25° C and were terminated by the addition of 4 ml of ice-cold 50 mM TRIS-HCl followed by rapid filtration through Whatman GF/B filters and three  
25 additional 4 ml washes in a cell harvester (Brandel). Competition studies were performed using a final concentration of 2.5 or 5 nM [ $^3\text{H}$ ](N)  $\text{PGE}_2$  and non-specific binding was determined with  $10^{-5}$  M unlabelled  $\text{PGE}_2$ .

For radioligand binding on the transient transfectants, plasma membrane fraction preparation was as follows. COS-7 cells were washed with TME buffer,  
30 scraped from the bottom of the flasks, and homogenized for 30 sec using a

Brinkman PT 10/35 polytron. TME buffer was added to achieve a final 40 ml volume in the centrifuge tubes. The composition of TME is 100 mM TRIS base, 20 mM MgCl<sub>2</sub>, 2M EDTA; 10N HCl is added to achieve a pH of 7.4.

5 The cell homogenate was centrifuged at 19000 rpm for 20 min at 4°C using a Beckman Ti-60 rotor. The resultant pellet was resuspended in TME buffer to give a final 1 mg/ml protein concentration, as determined by Biorad assay. Radioligand binding assays were performed in a 200 µl volume.

The binding of [<sup>3</sup>H] PGE<sub>2</sub> (specific activity 165 Ci or mmol<sup>-1</sup>) at EP<sub>3D</sub>, receptors and [<sup>3</sup>H]-SQ29548 (specific activity 41.5 Ci mmol<sup>-1</sup>) at TP receptors were  
10 determined in duplicate in at least three separate experiments. Radiolabeled PGE<sub>2</sub> was purchased from Amersham, radiolabeled SQ29548 was purchased from New England Nuclear. Incubations were for 60 min at 25°C and were terminated by the addition of 4 ml of ice-cold 50 mM TRIS-HCl, followed by rapid filtration through Whatman GF/B filters and three additional 4 ml washes in a cell harvester (Brandel).  
15 Competition studies were performed using a final concentration of 2.5 or 5 nM [<sup>3</sup>H]-PGE<sub>2</sub>, or 10 nM [<sup>3</sup>H]-SQ 29548 and non-specific binding determined with 10 µM of the respective unlabeled prostanoid. For all radioligand binding studies, the criteria for inclusion were >50% specific binding and between 500 and 1000 displaceable counts or better.

20 The effects of the compounds of this invention on intraocular pressure may be measured as follows. The compounds are prepared at the desired concentrations in a vehicle comprising 0.1% polysorbate 80 and 10 mM TRIS base. Dogs are treated by administering 25 µl to the ocular surface, the contralateral eye receives vehicle as a control. Intraocular pressure is measured by applanation pneumatonometry. Dog  
25 intraocular pressure is measured immediately before drug administration and at 6 hours thereafter.

The compounds of this invention are useful in lowering elevated intraocular pressure in mammals, e.g. humans.
